Colour Effect on White Oak

PU Oils are polyurethane modified oils based on renewable resources. Colour, protect and enhance the natural look and feel of wood surfaces.

These oils can be used on interior and exterior wooden surfaces such as furniture, flooring, roof trussing, windows, doors and decking.

Once applied the surface remains open pored, breathable and with an untreated appearance but imparts a silky-smooth surface resistant to water, oils, chemicals, and mechanical wear.

Characteristics:

- Retains the natural look and feel of wood.
- Oils are natural preservatives of wood.
- Resistant to external weathering.
- Easy to apply.
- Pleasant odour.
- Fast drying, handle within 5 minutes.
- Based on renewable resources.
- Solvent free.

Products:

1C PU Oil - 100% Polyurethane Oil, 1 component - Best performance.

2C PU Oil - 100% Polyurethane Oil, 2 component - Add 5% PU Oil Hardener to increase durability, weathering, chemical and mechanical resistance.

1C PU Oil LO - Linseed Oil modified for production facilities.

1C PU Oil WS - White Spirit modified for cost sensitive applications.

Application Process:

1. Remove traces of glue and contamination which will affect the absorption of the oil.
2. Abrade wood surface with 300 grit or finer sand paper. Finish off sanding in the direction of the grain by hand. this directly affects the smoothness of the final application.
3. Spray or rag apply the oil to evenly wet the surface.
4. Wipe off using a lint free cloth or rags ensuring no shiny spots remain.

Please Note: Samples shown serve only as a guide. The colour tone can vary depending on the type and features of the wood, the sanding of the grain, how it is applied and the structure of the surface. A test should always be done on a sample of the original wood to see the resulting colour tone. There are 40 standard colours to choose from and custom colours can be made upon request.
